Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A Map position: 28 min cycomponents I and two components II cycomplex: heterotetramer; two components I and two components II cycomplex: heterotetramer; two components I and two components II component of the component II is larger and its carboxyl-terminal two-thirds has anthranilate phose cypunction: cCOI>

A; Description: component I catalyzes the formation of anthranilate using ammonia rather to pencion: component II provides the glutamine amidotransferase activity cysuperfamily: trpd-trpd bifunctional enzyme; trpd homology; trpd homology cykeywords: carbon-carbon lyase; glycosyltransferase; oxo-acid-lyase; pentosyltransferase F4-187/Domain: trpd homology <TRG>
F4-187/Domain: trpd homology <TRG>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Annexal anthranilate synthase (EC 4.1.3.27) component II - Escherichia coli (strain K-12)
N/Contains: anthranilate phosphoribosyltransferase (EC 2.4.2.18); glutamine amidotransfe
C/Species: Escherichia coli
C/Species: Escherichia coli
C/Date: 30.Nov-1980 #sequence_revision 21-Nov-1997 #text_change 09-Jul-2004
C/Accession: B64874; A93746; A93168; IS6374; A01125

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rikawamukai, M.
submitted to the EMBL Data Library, December 1997
A; Description: S.pombe ribosomal protein L37 homolog.
A; Reference number: 222410
A; Accession: T43306
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-89 < KAM>A; Residues: 1-89

-!- PATHWAY: Second step in urea cycle, arginine biosynthesis.
-!- SUBUNT: Homotrimer.
-!- SUBCELLULAR LOCATION: Mitochondrial matrix.
-!- BISEASE: Sparse fur (spf) mouse have an OTCase with an overall decrease in activity, and altered substrate affinity.
-!- SIMILARITY: Belongs to the ATCase/OTCase family.

Qi H., Zakian V.A.;

"The Saccharomyces telomere-binding protein Cdc13p interacts with both the catalytic subunit of DNA polymerase alpha and the telomerase-associated est1 protein.";

Genes Dev. 14:177-1788(2000).

-: FUNCTION: Polymerase alpha in a complex with DNA primase is a replicative polymerase. Has a role in promoting telomere replication during interaction with CDC13.

-: CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate + ** EDNA** (N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mountain H.A., Bystroem A.S., Korch C.; "The general amino acid control regulates MET4, which encodes a methionine-pathway-specific transcriptional activator of Saccharomyces

MISCELLANEOUS: In eukaryotes there are five DNA polymerases:
alpha, beta, gamma, delta, and epsilon which are responsible for
different reactions of DNA synthesis.
SIMILARITY: Belongs to the DNA polymerase type-B family.
                                                                                                                                                                                                                                               01-JAN'1990 (Rel. 13, Created)
